ALGEBRAIC TOPOLOGY QUALIFYING EXAM

Write your answers on the test pages. Show all your work and explain all your
reasoning. You may use any standard result, as long as you state clearly what result
you are using (including its hypotheses). Exception: you may not use a result which
is the same as the problem you are being asked to do. Each problem has a noted
value, in total 40 points.

Name:		

Date: August 25, 2017.

1. (10 points) Let X

2. (10 points) Let X be the space obtained from identifying three distinct points on the 2-sphere S^2 . Compute the integer homolog groups of X.

3. (10 points) Show that if $f: \mathbb{RP}^{2n}$ X is a covering map of a CW-complex X, then f is a homeomorphism.

4. (10 points) Let M be a closed, connected, orientable real n-dimensional manifold and $f: S^n \to M$ a continuous map such that the induced morphism $f: H_n(S^n; \mathbb{Z}) \to H_n(M; \mathbb{Z})$ is non-trivial. Calculate $H_k(M; \mathbb{Q})$ for all k.

Di erential Topology Qual

June 8, 2017

Write your answers on the test pages. Show all work and explain all reasoning. You may use results from the class or course notes. Please write legibly!! Oh, and don't forget to put your name on the exam.

You must do Problems 1,2,3. You must do *either* Problem 4 or Problem 5. Please indicate clearly which of these last two you would like to be graded.

Problem 1. Prove that *n*-sphere

$$S^n = \{(x_1, \dots, x_{n+1}) \mid \mathbb{R}^{n+1} / x_1^2 + \dots + x_{n+1}^2 = 1\}$$

is a smooth manifold.

Problem 2. Suppose M is a smooth manifold.

- What is a tangent vector to M? What is a cotangent vector?
- What are the tangent and cotangent bundles *TM* and *T M*?
- What is a Riemannian metric on M?
- Explain how a Riemannian metric can be used to define a natural isomorphism between TM and T

Problem 3. Suppose G is an n-dimensional Lie group. Recall that a vector field v on G is left-invariant if (L_g) $(v_x) = v_{gx}$ for all g, x = G, where (L_g) denotes the differential of the map

$$L_q:G$$
 G

given by left-multiplication by g.

- Show that the set of left-invariant vector fields forms an *n*-dimensional vector space.
- ullet Prove that the tangent bundle TG is trivial.

Problem 4. Prove that there is a smooth vector field on S^2 which vanishes at exactly one point. (Hint: consider using the stereographic projection.)

Problem 5. Let be the (n-1)-form on \mathbb{R}^n $\{0\}$ given by

$$= ||x||^{-n} \cdot \bigcap_{i=1}^{n} (-1)^{i-1} x_i dx_1 \quad \cdots \quad dx_i \quad \cdots \quad dx_n.$$

Show that is closed but not exact on \mathbb{R}^n {0}. (Hint: for the latter, what happens if you integrate this form over S^{n-1} \mathbb{R}^n ?)
