x1: Algebraic Topology

(1) Consider the knot K S^3 depicted below. It is realized as a simple closed curve on a *standardly embedded* torus T S^3 , meaning that $S^3 \cap T$ consists of two open solid tori.

- (a) Choose a basepoint $2 S^3 n K$ and determine a presentation of $_1(S^3 n K;)$ involving two generators and one relator.
- (b) Summarize how you would show that K is not isotopic to a trefoil knot. (Full details are appreciated but not required.)
- (2) For a non-negative integer g, let g denote the closed, connected, orientable surface of genus g.
 - (a) Drawing inspiration from the picture below, brie y explain how to construct a 5-sheeted covering map 11 / 3.

- (b) Generalizing part (a), for every d; $g \ge Z$, d = 1, g = 0, explain how to construct a d-sheeted covering map $\frac{1}{g} = \frac{1}{g} = \frac{1$
- (c) Prove that if there exists a d-sheeted covering map h ! g, then d, g, and h are related as in the answer to part (b).
- (3) Prove that if M is a compact, orientable 3-manifold, then the kernel of the inclusion map $H_1(@M; \mathbb{Q})$ / $H_1(M; \mathbb{Q})$ is a half-dimensional subspace of the domain. (You may assume that the kernel of a linear map is isomorphic to the cokernel of its adjoint.)
- (4) (a) Describe a cell decomposition of $\mathbb{R}P^n$ involving one cell of each dimension from 0 to n inclusive.
 - (b) Write down the associated cell chain complex of RP^5 with Z coe cients. Brie y justify your calculation of the boundary maps.
 - (c) Calculate $H(\mathbb{R}P^5; \mathbb{Z})$.
 - (d) Suppose that X is a topological space with the property that $H(X;Z) = H(\mathbb{R}P^5;Z)$ as graded abelian groups. Determine the cohomology groups of X with Z=4Z coe cients. (Do not attempt to describe the multiplicative structure on the cohomology ring. Also note that you do not have a cell decomposition of X, just the isomorphism type of its ordinary homology groups).

x2: Di erential Topology

- (1) If M is a smooth manifold, show that the tangent bundle TM and the cotangent bundle T M are isomorphic. (Just as with vector spaces, there is no canonical isomorphism. You don't have to prove this, though. Also, feel free to assume anything that you like from linear algebra.)
- (2) A Lie homomorphism is a smooth homomorphism between Lie groups.
 - (a) Show that any Lie homomorphism : G / H has constant rank: that is, there exists some $k \ge Z$ such that rank(d_g) = k for all $g \ge G$.
 - (b) Suppose that G:H are connected n-dimensional Lie groups and G:H is a Lie homomorphism with discrete kernel. Show that G:H is a surjective di eomorphism. (In fact, G:H is a covering map, but the proof of this is homework-level rather than exam-level.)
- (3) Write $\mathbb{R}^n = \mathbb{R}^{n-k}$ \mathbb{R}^k and let G be the pseudogroup generated by all di eomorphisms between open subsets of \mathbb{R}^n that take horizontal factors to horizontal factors: that is,

()
$$(x, y) = (1(x, y), 2(y))$$

for $x \ 2 \ \mathbb{R}^n$ and $y \ 2 \ \mathbb{R}^k$. Show that G consists of all di eomorphisms between open subsets of \mathbb{R}^n whose Jacobian matrix at every point is an n matrix such that the lower left $(n \ k)$ k block is 0. (Showing that the set of di eomorphisms satisfying the Jacobian property is a pseudo-group is almost immediate, although you should at least say what the properties are. The real point here is to explain why it is the minimal pseudo-group containing all such .)

A G-structure on an n-manifold M is called a *codimension* k *foliation* of M. Since at least locally, the transition maps preserve the decomposition of \mathbb{R}^n into horizontal slices, these slices piece together to give a decomposition of M into submanifolds, called the *leaves* of the foliation.

- (4) Show that the antipodal map $A: S^n / S^n$, A(x) = x is homotopic to the identity if and only if n is odd. (Feel free to use Lefschetz theory if you would like.)
- (5) Show that a closed 1-form ! on a manifold M is exact if and only if $\frac{R}{S^1}f! = 0$ for every smooth map $f: S^1$! M. (Feel free to use Stokes' theorem, but you shouldn't reference deRham cohomology or anything that implicitly relies on this result.)
